USE OF A DRUG CAPABLE OF MODULATING THE REGULATION OF UPC-2
AND METHOD FOR SCREENING FOR POTENTIAL DRUGS AGAINST OBESITY.

5

Introduction

The present invention relates to method for treatment of obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus by administering a drug capable of
10 modulating the regulation of UCP-2 and the use of a drug capable of modulating the regulation of UCP-2 for the production of drug for treatment of obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus.

It also relates to method for screening for potential drugs against obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus comprising the measurement of
15 UCP-2 activity by biochemical, chemical or physical methods.

Background.

Obesity is a disease with strongly increasing prevalence, and has reached epidemic proportions in the industrialized world. This disease is essentially characterized by an
20 unbalance between energy intake and expenditure, which, without interference, leads to an ever increase in adipose tissue mass and body weight.

Appetite and energy intake is influenced by several hormonal effectors and neurotransmitters acting in the peripheral as well as the central nervous system. Examples
25 of neurotransmitters acting to increase appetite and concomitantly body weight, are neuropeptide Y, melanin concentrating hormone, and galanin, as well as glucocorticoid hormones. Examples of hormones or neurotransmitters that counteract feeding and stimulate reduction in adipose mass are melanocortin, corticotropin releasing factor, as well as the recently described peptide hormone leptin.

Brown adipose tissue (BAT) is a well characterized tissue which is well developed in newborn mammals, including man. One important task of BAT is to generate heat and maintain body temperature homeostasis in newborns, as well as in small animals, e.g. rodents.

The uncoupling protein, UCP-1, occurs in mitochondria, and seems to be the most important protein for generating heat in BAT. It does so by burning calories using a pathway that allows dissipation of the proton electrochemical gradient across the inner mitochondrial membrane in BAT during fuel oxidation. The fuel oxidation process is uncoupled for oxidative phosphorylation of ADP to ATP, thus generating heat which is distributed from BAT to the rest of the body via the circulation. The physiological external stimulus for uncoupling activity in BAT is cold temperature. This will increase the sympathetic nervous system activity and release of catecholamines leading to stimulation of beta3 adrenoreceptors present on the surface of brown adipocytes.

Recently, a new protein denoted UCP-2 has been discovered, which is expressed not only in BAT, but also in white adipose tissue (WAT), skeletal muscle, lung, heart, placenta, etc. (Fleury C, et al. (1997) "Uncoupling protein-2: a novel gene linked to obesity and hyperinsulinemia" *Nat Genet* 15(3), 269-272; Gimeno, RE., et al., (1997) "Cloning and characterization of an uncoupling protein homolog: a potential molecular mediator of human thermogenesis" *Diabetes* 46(5), 900-906). The UCP-2 protein has a 59% identity to UCP-1, and is upregulated in WAT in mice in response to feeding. This is in contrast to UCP-1, which is physiologically upregulated by cold in mice.

WO 9616031, The Upjohn Company, discloses aminoguanidine carboxylates, e.g. [1-(hydrazinoiminomethyl)hydrazino]acetic acid for the treatment of non-insulin dependent diabetes mellitus. The novel and claimed compounds reduce the abnormally elevated blood glucose level and have an increased glucose tolerance.

The invention

We have now found that a drug-induced upregulation of UCP-2 mRNA is possible.

Furthermore, we have found that, as a consequence of this, the level of UCP-2 protein
5 increases and mitochondrial activity and heat flow increase. This serves as a foundation
of the invention related to the drug-induced increase of metabolic efficiency, increase in
energy expenditure, and increase thermogenesis by genetic or transcriptional upregulation
of UCP-2 in adipose tissue. Drugs that increase energy expenditure are useful in the
treatment of obesity, non-insulin dependent diabetes, as well as the metabolic syndrome.
10 Obesity can be caused by different reasons such as non-insulin dependent obesity,
increase in triglycerides, increase in carbohydrate bound energy and low energy
expenditure.

An increase in energy expenditure includes the elevated utilization of both circulating and
intracellular glucose and triglycerides, free or stored as glycogen or lipids as fuel for
15 energy and/or heat production.

Our invention relates to a method for treatment of obesity, metabolic syndrome and/or
non-insulin dependent diabetes mellitus by administering a drug capable of modulating
the regulation of UCP-2 mRNA, thus an increase of metabolic efficiency, increase in
energy expenditure, and increase thermogenesis by genetic or transcriptional upregulation
20 of UCP-2 in adipose tissue. It also relates to the use of a drug capable of modulating the
regulation of UCP-2 mRNA for the production of drug for treatment of obesity, metabolic
syndrome and/or non-insulin dependent diabetes mellitus and pharmaceutical
composition comprising a pharmaceutically effective amount of such a drug.

The invention is also related to methods for screening for potential drugs against obesity,
25 metabolic syndrome and/or non-insulin dependent diabetes mellitus as defined in the
claims and other aspects, also defined in the claims.

The measurement of UCP-2 activity as upregulation of UCP-2 transcription /mRNA can
be done by biochemical, chemical or physical methods, all well known for persons skilled
in the art.

Screening with pharmacological or biochemical methods can e.g. be performed on mice by the use of candidate drugs or on cell-lines such as 3T3-L1 or 3T3-F442A, that optionally can be differentiated to adipocyte like cells.

The gene for UCP-2 and a reporter-gene (e.g. E coli β -galactosidase, chloramphenicol acetyltransferase, alkaline phosphatase or firefly luciferase) can also be used for the measurement of the UCP-2 activity.

The invention is illustrated with four examples, using an aminoguanidine carboxylic acid, [1-(hydrazinoiminomethyl)hydrazino]acetic acid, (AG) as the substance capable of modulating the regulation of UCP-2. This is, however, no limitation of the invention in its broadest aspects.

Definitions

C5BL/6J ob/ob mice	Obese mice homozygous for a point mutation in the <i>OB</i> gene
SSPE	Sodium chloride (0.15 M), Sodium phosphate (10 mM), EDTA
5	(1 mM), pH 7.4
SDS	Sodium dodecylsulphate
AG	[1-(hydrazinoiminomethyl)hydrazino]acetic acid

Example 1. Upregulation of UCP-2

- 10 Six C57BL/6J ob/ob mice (Bomholtsgård, Denmark) were treated by peritoneal injection with either the compound AG (80 mg/kg) or saline (3 mice in each group). The mice were sacrificed after 20 hours and intra-abdominal fat, and skeletal muscle samples were removed from each mouse. Total RNA was extracted from these samples using the guanidinium thiocyanate method essentially as described by Sambrook *et al*, (1989)
- 15 "Molecular cloning: a laboratory manual", Cold Spring Harbor Laboratory Press, (2nd edition).

The tissues were homogenized, together with 6 ml GTC (4M guanidinium thiocyanate, 25 mM Na-citrate, 8.06 mM 2-mercaptoethanol, final adjusted pH 7.0) in a Polytron homogenizer (Brinkmann) at high speed for 1-2 minutes. 300 ml, 10% sodium lauryl

20 sarcosinate was added to a final concentration of 0.5%, then mixed thoroughly. This was centrifuged at 5000g, 10 minutes at room temperature.

The supernatant was transferred to a 50 ml Falcon tube and drawn six times through a 22-gauge needle. The tissue/GTC solution was layered on a 5.7 M cesium chloride solution (buffered by 8 mM sodium acetate and sterile filtered) and centrifuged at 32000 rpm in a

25 swing-out SW41 rotor for 17 hours at room temperature.

The pellets were dissolved in 2x200 ml diethylpyrocarbonate (DEPC) treated water and transferred to microcentrifuge tubes. One tenth of the volume of 3M sodium acetate and 2 volumes of 95% ethanol was then added, followed by precipitating the RNA in -20°C for more than 30 minutes. The RNA was collected by centrifugation at 15000g, 15 minutes

at 4°C. The pellet was washed in 70% ethanol and centrifuged for 5 minutes at 15000g. The supernatant was removed and the pellet was vacuum dried for 5 minutes. The RNA was resuspended in 100ml DEPC-treated water and kept on ice.

The integrity of the RNA was confirmed by separation on a 1% MP agarose (Boehringer Mannheim) gel. The RNA was then capillary blotted onto a GeneScreen Plus (DuPont NEN Research Products) membrane. The protocols used for the transfer and detection of the RNA are found in the technical manual: "GeneScreen and GeneScreen Plus; Hybridization Transfer_Membranes; Transfer and Detection Protocols". DuPont, NEN Research Products, 549 Albany St., Boston, MA, USA.

10

The cDNA probe used for detecting UCP-2 was derived from the I.M.A.G.E. consortium clone No. 440295 and was amplified from the pT7T3D-Pac vector (Pharmacia&Upjohn) by PCR using the two primers 5'-CCAGTCACGACGTTGTAAA-3' and 5'-CACAGGAAACAGCTATGAC-3'. The probe was purified from a low-melting agarose gel prior to ³²P labelling which was carried out with the RediPrime DNA labelling kit kit (Amersham).

The RNA blotting filter was hybridized with the labelled probe in a 50% formamide solution at 42°C overnight with subsequent high stringency washing using four 2xSSPE for 15 minutes at room temperature, followed by two 2xSSPE, 2% SDS for 45 minutes at 65°C and, finally, two 15 minute washes in 0.1xSSPE at room temperature. After the final wash, filter bound radioactivity was detected and quantified using a PhosphorImager (Molecular Dynamics, Inc.). The results are shown in Figure 1. (top panel). After washing to remove filter-bound radioactivity, the RNA blotting filter was also hybridized to a ³²P-labelled probe based on human β -actin cDNA to serve as a control for the mRNA content of each lane. The results are shown in Figure 1. (bottom panel).

25

The relative expression levels of UCP-2 mRNA between samples of saline and AG treated mice, was calculated using the PhosphorImager radioactive counts detected within the bands corresponding to UCP-2 mRNA, and normalized against the radioactive counts within the bands corresponding to actin, the latter of which do not change significantly
5 between saline and AG treated samples. The data (illustrated in Figure 2.) indicate a 3.6-fold induction of UCP-2 mRNA in white adipose tissue after treatment with AG, and a 1.3 fold induction in skeletal muscle.

Figure legends

10 Figure 1. Top panel: RNA blotting filter hybridized to ^{32}P -labelled human uncoupling protein-2 cDNA probe. Lane 1, white adipose tissue from saline treated mice; lane 2, white adipose tissue from AG treated mice; lane 4, skeletal muscle from saline treated mice; lane 4, skeletal muscle from AG treated mice.

Bottom panel: RNA blotting filter hybridized to ^{32}P -labelled human β -actin cDNA
15 probe. Lane 1, white adipose tissue from saline treated mice; lane 2, white adipose tissue from AG treated mice; lane 4, skeletal muscle from saline treated mice; lane 4, skeletal muscle from AG treated mice.

Figure 2. Regulation of UCP-2 mRNA levels in white adipose and skeletal muscle tissue
20 by AG. The white bars indicate saline treated control tissue, and the stippled bars indicate AG treated tissue. The UCP-2 mRNA levels were determined with a PhosphorImager (Molecular Dynamics) and are normalized against actin mRNA levels.

From these figures it is clearly seen that UCP-2 mRNA is strongly upregulated by AG in
25 white adipose tissue compared to treatment with placebo (saline). This is in contrast to skeletal muscle where only a marginal change in UCP-2 mRNA levels could be seen.

Example 2. Increase in mitochondrial activity

Further experiments have shown that aminoguanidine carboxylic acid (AG) increase mitochondrial activity (Figure 3) and the generation of reactive oxygen species (ROS) (Figure 4) in human neuroblastoma cells treated for 2 days.

5

Example 3. Microcalorimetry.

In SH-SY5Y cells, as well as in L6 (rat myocytes) cells AG has been shown, by microcalorimetry, to be thermogenic. The increase in heat production initiated by the AG required several hours of incubation to establish (Figure 5).

10

Example 4. Cytometer

L6 cells and SH-SY5Y cells were shown to express UCP2 on the mRNA-level as well as the protein level. Using a laser scanner cytometer it was possible to show a shift in the peak fluorescence of antibody labelled UCP2 protein in SH-SY5Y cells after AG treatment. Increases in the protein level of UCP2 in SH-SY5Y could be detected after treatment with AG by standard flow cytometry. (Figure 6).

15

Conclusion

These data indicate the first example of a drug-induced upregulation of UCP-2 mRNA. Furthermore, we have found that, as a consequence of this, the level of UCP-2 protein increases and mitochondrial activity and heat flow increase.

20

This serves as a foundation of an invention related to the drug-induced increase of metabolic efficiency, increase in energy expenditure, and increase thermogenesis by genetic or transcriptional upregulation of UCP-2 in adipose tissue. Drugs that increase energy expenditure are useful in the treatment of obesity, non-insulin dependent diabetes, as well as the metabolic syndrome.

25

CLAIMS

5

1. Method for treatment of obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus by administering a drug capable of modulating the regulation of UCP-2.

10 2. Method according to claim 1 in which the drug is capable of modulating the regulation of UCP-2 mRNA cellular levels.

3. Method according to claim 1 in which the drug is capable of modulating the transcriptional activity of the gene encoding UCP-2.

15

4. Use of a drug capable of modulating the regulation of UCP-2 for the production of drug for treatment of obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus.

20 5. A pharmaceutical composition comprising a pharmaceutically effective amount of an agent capable of modulating the regulation of UCP-2.

6. Method for screening for potential drugs against obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus comprising the measurement of UCP-2 activity
25 by biochemical, chemical or physical methods.

7. Method according to claim 6 in which the upregulation of UCP-2 gene transcription and/or mRNA levels are measured.

8. Method for screening for an agent capable of regulating UCP-2 transcription/ mRNA comprising the steps of

- contacting an animal/or cell line with the potential agent
- 5 measuring the level of UCP-2 transcription /mRNA
- choosing the agent causing an increased level of UCP-2 transcription /mRNA in comparison to control.

9. Method for screening according to claim 8

- 10 comprising the steps of
 - contacting an animal/or cell line with the potential agent
 - measuring the difference in level of UCP-2 transcription/ mRNA between adipose and other cells
 - choosing the agent causing a higher level of transcription of UCP-2 mRNA in
 - 15 adipose than in skeletal muscle cells , indicating that the agent can modulate the regulation of UCP-2 mRNA

10. Method according to claims 8 or 9 in which the animal/or cell line is derived from adipose tissue.

20

11. Use of cDNA probe for determination of upregulation of UCP-2 for potential drugs against obesity, metabolic syndrome and/or non-insulin dependent diabetes mellitus.

12. Use according to claim 11 in which adipose tissue is used.

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 1-3
because they relate to subject matter not required to be searched by this Authority, namely:
See PCT Rule 39.1(iv): Methods for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

The subjects, defined by the problems and their means of the solution as listed below are so different from each other that no technical relationship can be appreciated to be present so as to form a single general inventive concept.

- 1) Claims 4-5 use of a drug capable.....and a pharmaceutical composition....
- 2) Claims 6-11 method for screening....and use of cDNA probe...

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
